

Autumn Design Engineer Take Home 2

At a glance

- **The task:** design and build a new marketing dashboard with two connected screens, live and deployed.
 - **Time:** you have 24 **hours** from receiving this brief.
 - **You send back:** one live URL, a repo link, and screenshots of your work.
 - **Send to:** aaryan@autumnplatform.com
 - **Questions:** email aaryan@autumnplatform.com at any point.
-

The tasks

Autumn helps independent hotels understand whether our marketing work is driving more direct bookings and revenue. Today, the dashboard has useful information, but it can feel dense, technical, and overwhelming for a hotel owner who is short on time.

Your assignment has two connected parts:

Task 1: Redesign the main marketing dashboard

Design and build the primary dashboard screen a hotel owner would see first.

This screen should answer the most important customer question: **is Autumn helping my hotel get more direct bookings and revenue?**

What belongs on that first screen is up to you. We want to see your judgment: what you keep, what you demote, what you simplify, what you explain, and how you make the experience feel calm instead of intimidating.

Task 2: Design a connected detail screen

Design and build a second screen that connects naturally from the main dashboard.

The second screen should let the hotel owner go deeper into one important area without making the first screen feel crowded. You can choose the focus. For example, it could be website traffic, campaign performance, feeder markets, booking attribution, visitor behavior, insights, or another connected area you think matters more.

The second screen should feel like part of the same product experience. It should use the same data source, the same customer-centered thinking, and a clear navigation path from the first screen.

Together, the two screens should show that you can design both the executive-level experience and the deeper supporting view.

Reference dashboard

Use the screenshots below as reference for the current product surface. You do not need to copy the layout. The goal is to rethink it.

Current Autumn marketing dashboard, overview

Current Autumn marketing dashboard, website traffic

What is on the current dashboard

Reference photo 1: Marketing dashboard overview

- **Autumn Results:** Shows the number of bookings and booking value Autumn has driven for the hotel.

- **Total Impressions from Ads:** Shows how many times the hotel appeared in paid advertising placements.
- **Total Website Visits from Ads:** Shows how many people clicked from ads to the hotel website.
- **Total Booking Value:** Shows the total dollar value of bookings attributed to Autumn.
- **Trends Over Time:** Shows how performance changes across the selected date range.
- **Funnel and Website Engagement:** Shows how people move from impressions to clicks to purchases, including conversion rate (CVR), new visitors, and pages per session.
- **Insights:** Highlights notable changes, wins, or issues that the hotel owner may care about.
- **Campaign Summary:** Breaks performance down by campaign category, including impressions, clicks, click-through rate (CTR), and bookings.
- **Device Summary:** Shows performance by device type, including clicks, click-through rate (CTR), and booking value.
- **Feeder Markets:** Shows which geographic markets are sending visitors and bookings to the hotel.

Reference photo 2: Website traffic detail

- **Autumn Results:** Repeats the most important outcome metrics so the user stays oriented while looking at traffic details.
- **Total Impressions from Ads:** Shows how often ads appeared during the selected period.
- **Click-Through Rate (CTR) from Ads:** Shows the percentage of ad impressions that turned into clicks.
- **Website Visits from Ads:** Shows how many website visits came from paid ads.
- **Traffic by Device:** Shows whether visitors are coming from desktop, mobile, or tablet.
- **Traffic by Time of Day:** Shows when visitors are most likely to arrive on the website.

- **Visitor Demographics:** Placeholder area for demographic details when that data is available.
- **Funnel and Website Engagement:** Shows the path from impressions to clicks to purchases, along with engagement metrics like new visitors and pages per session.
- **Top Traffic Channels:** Shows which channels, such as organic search, direct traffic, or paid search, are driving visits.
- **Page Views:** Shows which website pages visitors are viewing most often.
- **Events:** Shows important website actions, such as page views, user engagement, and session starts.
- **All Website Visitors:** Shows visitor volume by city, region, and country.

You can decide how much of this should remain visible, how it should be grouped, and what should be moved into the second screen or behind progressive disclosure. The point is not to show every metric at once. The point is to help a hotel owner quickly understand performance, trust the work, and know what matters.

Product context

Autumn's customer is not a growth marketer.

They are usually an owner-operator of an independent hotel, inn, B&B, ranch, lodge, or boutique property. They may be the front desk, the marketing department, the revenue manager, and the person fixing the towel rack, all in the same day.

They care about questions like:

- Did Autumn help me get more direct bookings?
- How much revenue did that create?
- Are the right guests finding my property?
- What changed since last month?
- Is anything concerning?
- What is Autumn doing about it?

They may not know what click-through rate (CTR), conversion rate (CVR), campaign categories, attribution, or funnel conversion mean. If those concepts are useful, make them understandable.

The experience should feel calm, hospitality-native, and confidence-building, not like an ad platform.

Requirements

1. Build two connected screens

Build a working, deployed dashboard experience with:

- A main marketing dashboard screen
- A second connected detail screen
- Navigation between the two screens
- A coherent information hierarchy across both screens

The two screens should feel intentionally connected. The second screen should not be a random extra page. It should help explain or support something important from the first screen.

2. Use React, Next.js, and a real hosted database

Build the project using:

- React
- Next.js
- A hosted database of your choice

The dashboard must actually fetch and render data from the database. If the dashboard is hardcoded, the submission will not pass.

You may use any styling system, charting library, user interface (UI) library, or backend approach you think is appropriate, as long as the final result is polished, fast, and reliable.

3. Seed your own database

Create and seed a hosted database with at least **720 days** of plausible, meaningful marketing data.

Free-tier infrastructure is completely fine. Examples include Supabase, Neon, MongoDB, or another hosted database you prefer.

Your data model is part of the assignment. It should generally represent the kind of information in the reference dashboard, but it should not be random noise. The data should feel realistic for an independent hotel marketing program.

Your seeded data should support both screens. If the dashboard shows seasonality, campaign performance, feeder markets, bookings, revenue, visitor behavior, or trend comparisons, the underlying data should make those views believable.

A seeding script is a positive signal. We want to see how you think about data shape, data quality, and repeatable setup.

4. Design for hotel owners

The redesigned dashboard should be less intimidating and less overwhelming than the current version.

Use your own judgment to decide:

- What the user should see first
- What belongs on the main screen
- What belongs on the second screen
- Which metrics deserve emphasis
- Which metrics need plain-language explanation
- Which details should be available but not dominant

- How to show progress, wins, problems, and next steps
- How to make the dashboard feel useful without making it feel like homework

We are especially interested in how you translate data into a customer experience. The dashboard should help the hotel owner feel oriented, not buried.

What to send back

1. One live URL

- Both screens should be reachable.
- If login is required, include test credentials.

2. A repo link

- Include setup instructions.
- Include database setup and seeding instructions.

3. Screenshots

- Include the old/reference dashboard.
- Include your redesigned main screen.
- Include your connected second screen.

How we'll evaluate it

- **Product judgment:** Does the dashboard make the right information obvious for a hotel owner?
- **Design craft:** Does it feel polished, calm, clear, and appropriate for independent hospitality?
- **Engineering quality:** Is it built well, connected to a real database, responsive, and maintainable?
- **Data realism:** Does the seeded data feel plausible, meaningful, and connected to the dashboard experience?

Important constraints

- Do not hardcode the dashboard data.
- Do not spend time building unrelated product surfaces.
- Do not optimize for showing the most charts. Optimize for showing the right information.
- You may use AI tools however you would use them on the job.

Follow-up conversation

We'll schedule this meeting on completion of this project and will use the conversation to discuss:

- Your design decisions
- What you believed mattered most to the hotel owner
- Why you chose the second screen
- How you structured the data
- Any technical tradeoffs you made
- What you learned while building it
- What you would do next with more time

We care less about whether you guessed our preferred answer and more about how you reasoned from the customer, the data, and the constraints.

Submission
